Retrieved July 23, Research is still preliminary and more research is needed to improve, clarify, and validate the current results. A new model of liquid crystal behavior in mixtures of small molecules and mesogen molecules. We propose a model of the orientation dynamics of molecules in anisotropic media with long-range interactions and demonstrate that the observed behavior of anisotropy can be reproduced, if the mixtures are composed of the two species of molecules, namely, the small, flexible molecules and the mesogen molecules, arranged in the form of a liquid crystal phase. For this purpose, the orientation order parameter, which describes the long-range orientation of the molecules, has been determined in the mixtures with a certain choice of parameters and the asymptotic behavior of the orientational correlation function, calculated by using the theory of the liquid crystal, has been compared with the experimental data. It has been shown that the influence of the mesogen molecules is strong and is of key importance in the long-time orientation relaxation. The liquid crystalline mesogen molecules hinder the motion of molecules in the opposite orientation relative to each other. The model can be useful in predicting the behavior of anisotropic materials in the near-infrared and THz spectral ranges. A firefighter reacts as firefighters battle the Waldo Canyon fire on the north side of Colorado Springs on Wednesday, Aug. 2, 2013. (Brennan Linsley, The Colorado Sun) The fire started Thursday afternoon in the Bear Creek area, a remote corner of the city. Winds picked up Thursday night and the fire spread rapidly. It jumped to Waldo Canyon in the northeast corner of the city around 6 a.m. Friday, and the race for containment has been on since. The Boulder County Sheriff's Office said the Bear Creek 82157476af
